Annual Program Review

College of the Siskiyous

Fire Technology Program

2020

1. Describe Annual Progress/changes/events in the programs.
   The fire program falls under four areas, State Fire Training (academy), State Fire Training (stand-alone), College of the Siskiyous (core), and College of the Siskiyous (special requests). Expansion/changes of programs.

   a. All State Fire Training courses follow the State Program Course Outlines and any changes are based on those documents. We update as that direction is placed upon us.
   b. College of the Siskiyous core classes are run in a packet of three per semester for a total of six classes. That meet all the requirements from State Fire Marshall and the college degree program. They only change when new information or books change to the material.
   c. College of the Siskiyous special requests programs are those that a local department wants to run through the college for training credit but are not State Fire Training listed.
   d. College of the Siskiyous along with State Fire Training work together as we look to expansion or changes of our programs. An example of this would be a two day auto extrication class that is taught in the FF I academy can be expanded under FF II as the three day vehicle extrication class and also used as a stand-alone class.

2. Describe progress on assessing the SLOs and PLOs for the program.
   a. For SFT classes the SLOs and PLOs are defined in the course outline and are reviewed via the student evaluations back to SFT as well as the Instructors on their course topics taught. That information is then passed to the Coordinator for review and to monitor progress of the evaluation of both SLOs and PLOs.
   b. College the Siskiyous core classes are established via our Elumne program and need to be updated in the system to make sure the SLO's and PLO's still match. The students are evaluated via quizzes and exams.
   c. College of the Siskiyous special requests are not evaluated via the college other than maintaining the system via meeting the catalog requirements.

3. Discuss any support or obstacles encountered by the program.
   a. Staff help has always been an issue and I see this as a continued issue into the future. Administrative assistance has been addressed and that portion will have a positive impact on the program overall. Mandated non- funded regulations passed down from SFT or Accreditation/Testing issues drives some of the obstacles in we have to vs we need to or just how are we going to do this. A solution for this would be to provide a fulltime classified position to support the needs of the program. Those tasks of updating classes, tracking inventories, clerical assistance would allow the Instructional Aids and Expert Instructional Aids more time to support the Instructors in the day-to-day operations. The use of student helpers was tried, but due to their schedules and other commitments created more issues rather than benefits to the program.

4. Describe any program budgetary needs or implications.
   a. Rescue: Rope Rescue Technician is next in line of expansion to our program. We have several instructors waiting to have their task books signed off by a master instructor so that they can become the primary instructors for our program. In order for that to occur, we will need to provide the class, increase our inventories of equipment, provide a consultant fee for the instruction and sign off. This allows us to offer this future program to the fire service and increase enrollments/FTE funding.
   b. Props: Replacement of the flashover building (one of the first buildings on the grounds) has more than lived it's full life. The repair costs are quickly overcoming the ability of the program for it's use and a priority to replace must be considered number one. The cost to replace this prop via a vendor is in the area of 60,000-80,000 dollars. Keeping that in thought in mind a secondary solution is to having out welding program complete the work of the prop after providing the materials needed. The discussion with the lead instructor assures me that the task can be completed and will aid in the student instruction of his program. I have requested a bid for material and shipping to aid in this project and will submit upon its arrival.
   c. One Fulltime Classified position: As stated under number 3 above, the support of this position to update courses, tracking of inventories (during and between semesters), clerical assistance to all areas of the fire program.
   d. One Fulltime Instruction position: This requests has been placed every year for the last five years to support the program, after the down slope of enrollment occurred the two positions was reduced to one position. The increase in demands from State Fire Training as well as the college instructional program, the use of another full-time staff would increase the ability to meet the current and expanding requirements, span of control, subbing for

instructors of last minute emergencies, sharing the workloads of the program, increase the ability to attend required meetings, attend in-service trainings provided by State Fire Training, attend county fire meeting with service providers, formulate the Cap-Stone testing just to name a few.

e. Hose and appliances: This equipment demand is ever changing as well in this program. We often can use "retired" hose as dragging around in a training use instruction, but when we have cadets in "live fire" situational training, we need to use current lifeline that meets hose testing, requirements for entry. This is for both the Structural and Wildland programs, of academy and stand-alone programs. Nozzles and appliances fall in this same category as hose. Hose packs and support items to meet the requirements of CalFire and USFS places demands that we clearly have to upgrade our inventories.

f. Engine repair: Our type three, (wildland engine) needs to have the pump and fittings inspected and repaired to insure its function to the fire program as well as the Fire Wardens contract for hire program. This is more in-depth than routine oil changes etc., this is repairs that have to be completed by a certified fire pump technician. CalFire stated that due to their increase in workload they would no longer be able to provide this service to the college, therefore, this needs to be addressed for functional need.

g. Physical Training: Our PT program uses all aspects of equipment to meet its goals of "job related" training. The gym equipment provided to us by the Athletics department serves us well, however the field-hiking portion can be served with the addition of weight vests and work up the using hose packs for field endurance.

h. Fire Grounds: Concrete pad needs to be placed in the square area of the con-x boxes to allow the Rescue Systems props to be housed. During this program our concrete props have had to be moved by maintenance to a hard surface area causing the potential for damage to the back-hoe or loader. It was suggested that if an area could be concreted where the mobile props could be moved to once, they could be moved once and the class then would be able to adjust them as needed, therefore, reducing the workload of maintenance and potential damage to their equipment. The area is approximately 40' by 36' and the depth of the pour would have to be calculated to hold the weight of the props.

Submitted: Captain Mike Wilson, Chief of Fire Technology
